WS Video Tutorials - Complex
2.2 Combining SAP Tabs

Steps to combine SAP tabs:

- Start a recording in Designer on the first tab.
- Complete the full process you want to automate, including the fields on additional tabs.
- Stop the recording. Copy/paste it on the screen to be used.
- Modify the screen you want the user to see. Remove unnecessary fields/tabs and add custom fields.
- Create a text field with the description you want the user to see. Create an edit field for the user to type data in.
    - Right-click -> Properties on the edit field. Go to the Parameters tab, type in a variable name.
- For limiting values use Radio buttons:
    - Radio buttons will have the same variable name.
    - Different values for each radio button.
- Modify screen combine function and change the set commands to use the variables:
    - Change the defaulted value on the right of the set command with &V[z_variable_name]
- Call the function by overwriting the default Save functionality. Use the onUIEvents command:
    - onUIEvents["/11"]={"process":quickTabNotification};
    - Note: "/11" is reserved in SAP for saving.
- Save in Designer and all the changes will appear in SAP.
